

Ini rangkuman step dari awal sampai Next.js berhasil jalan di kondisi kamu (npm official kena 403, jadi pakai mirror).

1. Masuk ke folder project

Kamu punya folder:

```
```text
```

```
C:\Users\produ\OneDrive\Documents\nanda\b7_dummy
```

```
```
```

Masuk:

```
```cmd
```

```
cd C:\Users\produ\OneDrive\Documents\nanda\b7_dummy
```

```
```
```

```
---
```

2. Cek masalah npm registry

Awalnya:

```
```cmd
```

```
npm install next
```

```
```
```

kena:

```
```text
```

```
403 Forbidden registry.npmjs.org
```

```
```
```

Cek:

```
```cmd
```

```
npm config get registry
```

```
```
```

Normal:

```
```text
```

```
https://registry.npmjs.org/
```

```
```
```

Tapi network kamu blok registry itu.

3. Ganti npm registry ke mirror

Pakai:

```
```cmd
```

```
npm config set registry https://registry.npmmirror.com
```

```
```
```

Cek:

```
```cmd
```

```
npm config get registry
```

```
```
```

Hasil:

```
```text
```

```
https://registry.npmmirror.com
```

```
```
```

Tes:

```
```cmd
```

```
npm ping
```

```
```
```

Kalau sukses:

```
```text
```

```
PONG
```

```
```
```

berarti sudah bisa install package.

4. Buat project Next.js

Karena kamu sudah berada di folder:

```
```text
```

```
b7_dummy
```

...

dan mau project langsung di situ:

```
```cmd
```

```
npx create-next-app@latest .
```

...

Penting:

* `` artinya folder sekarang

* Kalau pakai `my-app`:

```
```cmd
```

```
npx create-next-app@latest my-app
```

...

akan membuat folder baru:

```
```text
```

```
b7_dummy
```

```
+-- my-app
```

...

5. Kalau sebelumnya pernah `npm init -y`

Hapus dulu:

```
```cmd
```

```
del package.json
```

...

Karena Next.js mau membuat `package.json` sendiri.

---

## 6. Pilihan setup Next.js

Saat muncul:

...

Would you like to use the recommended Next.js defaults?

...

Pilih:

...

Yes

...

Itu otomatis membuat:

\* TypeScript 

\* Tailwind CSS 

\* ESLint 

\* App Router 

\* Turbopack 

---

## 7. Setelah selesai

Struktur:

```
```text
```

```
b7_dummy
```

```
+-- app
```

```
| +-- layout.tsx
```

```
| +-- page.tsx
```

```
| +-- globals.css
```

```
+-- public
```

```
+-- node_modules
```

```
+-- package.json
```

```
+-- next.config.ts
```

```
+-- tsconfig.json
```

```
```
```

---

## 8. Jalankan development server

```
```cmd
```

```
npm run dev
```

```
```
```

Output:

```
```text
```

```
Local: http://localhost:3000
```

```
```
```

Buka browser:

```
```
```

```
http://localhost:3000
```

```
```
```

---

## 9. File yang sering diedit

Halaman utama:

```
```text
```

```
app/page.tsx
```

```
```
```

Layout global:

```
```text
```

```
app/layout.tsx
```

```
```
```

CSS global:

```
```text
```

```
app/globals.css
```

```
```
```

Foto/image:

```
```text
```

public/

...

Contoh:

...

public/logo.png

...

dipanggil:

```
```tsx
```

```

```

...

---

## 10. Kalau bikin halaman baru

Jangan:

...

app/dashboard.tsx ☒

...

Tapi:

...

app/dashboard/page.tsx ☑

...

otomatis:

...

localhost:3000/dashboard

...

---

## 11. Kalau migrasi dari Echo SSR

Mapping:

Echo	Next.js

Echo	Next.js
dashboard.html	app/dashboard/page.tsx
login.html	app/login/page.tsx
assets/img	public
template sidebar	layout.tsx

---

## 12. Kalau pindah laptop / project baru

Jangan lupa set mirror lagi:

```
``cmd
```

```
npm config set registry https://registry.npmmirror.com
```

```
...
```

Lalu:

```
``cmd
```

```
npx create-next-app@latest .
```

```
...
```

---

Versi super singkatnya:

```
``cmd
```

```
cd project-folder
```

```
npm config set registry https://registry.npmmirror.com
```

```
npm ping
```

```
npx create-next-app@latest .
```

```
npm run dev
```

```
...
```

Itu alur yang berhasil di mesin kamu.
