

Cara install dari nol (PC baru)

Misal mau bikin project baru dari template ini.

1. Pastikan PC ada:

Node.js

Cek:

node -v

Contoh:

v22.x.x

npm

npm -v

2. Clone repo

Masuk ke folder tempat project:

Contoh:

cd C:\Users\produ\Documents\Projects

Clone:

git clone https://github.com/b7pgd/next_js_dummy.git nama-project

Contoh:

git clone https://github.com/b7pgd/next_js_dummy.git leak-tester-dashboard

Hasil:

Projects

+-- leak-tester-dashboard

+-- app

+-- public

+-- package.json

+-- package-lock.json

+-- .npmrc

+-- ...

3. Masuk project

```
cd leak-tester-dashboard
```

4. Install dependency

```
npm install
```

Karena ada:

```
.npmrc
```

dengan:

```
registry=https://registry.npmmirror.com
```

npm otomatis pakai mirror.

Jadi tidak perlu ulang:

```
npm config set registry ...
```

5. Jalankan

```
npm run dev
```

Output:

```
^ Next.js
```

```
- Local: http://localhost:3000
```

Buka:

```
http://localhost:3000
```
